

Packaging Recommendation System

Project Overview

The Packaging Recommendation System is an AI-driven project developed as part of the Infosys Springboard Internship. It recommends sustainable and cost-effective packaging materials by analyzing material properties, environmental impact, and cost factors.

Problem Statement

Selecting the right packaging material is challenging due to conflicting factors like cost, durability, recyclability, and CO₂ emissions. This project automates the decision-making process using data-driven techniques.

Objectives

- Analyze raw packaging material data
- Clean and preprocess datasets
- Engineer sustainability-related features
- Train ML models for recommendation
- Rank materials based on suitability score

Milestone 1: Data Preprocessing

Data cleaning, handling missing values, feature engineering, and validation.

Milestone 2: Model Training & Evaluation

Normalization, model training, prediction, and ranking of materials.

Tools & Technologies

Python, Pandas, NumPy, Scikit-learn, VS Code, Git & GitHub

Conclusion

The project demonstrates how AI can support sustainable packaging decisions effectively.
